IDS Hackathon 2017

The file Datathon1.csv contains data for 95,753 people who registered for the National Programming Aptitude Test (NPAT), conducted on August 13, 2017.

Columns A, B and C indicate details about each participant, and columns D, E, ..., K indicate the scores obtained on each question (1, 2, ..., 8) in the test. The maximum score on each question was 100, and unattempted questions have a score of -1.

Use your knowledge of Data Science to present two interesting findings from this data. Examples of interesting findings could include:
1) identifying a certain group of participants whose scores are very different from others
2) identifying which questions were the hardest and which were the easiest (see questions.txt for the questions and their solutions; the file will be shared during the event)
